DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claims 1 – 30 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lehto et al. (WO 99/54730) (hereinafter “Lehto”) in view of Verwaerde et al. (U.S. Pat. Appl. No. 2004/0038227) (hereinafter “Verwaerde”).

Lehto teaches a method for performing biochemical analysis using small amounts of liquid sample that comprises the merging of two sample solutions comprising a drug candidate and a drug target on a substrate using electrostatic forces. Lehto teaches the use of parallel electrodes arranged on a substrate for facilitating the transport and manipulation of sample droplets during sample processing and analysis (see, e.g., pages 7, 8 and 25 – 38). Lehto teaches the use of a temperature-controlled environment (see, e.g., page 18).

Art Unit: 1743

Lehto is silent to teaching the detecting and comparing the heats of reaction during the analysis.

Verwaerde teaches methods for drug screening and development using microcalorimetric devices (see, e.g., paragraphs 39 – 48). Verwaerde teaches the benefits of using microcalorimetric devices in performing process measurements (see, e.g., paragraph 9). Consequently, as indicated by Verwaerde, a person of ordinary would accordingly have had a reasonable expectation for success of employing the use of microcalorimetric devices and methods for facilitating the effective screening of assay samples (see MPEP § 2143.02). Therefore, it would have been obvious to a person of ordinary skill in the art to incorporate the use of a microcalorimetric methodology as claimed in facilitating the effective assay testing.
